

THE SOLO FOUNDER SERIES

Build Your AI Chief of Staff

Turn any AI assistant into a chief of staff that runs your day, protects your focus, and never forgets your context.

Why a chief of staff, not a chatbot

Most people use AI like a vending machine: ask a question, get an answer, forget it ever happened. A chief of staff is different. It holds your goals, sets your plan, remembers every decision, and keeps you moving when you stall. This guide shows you how to build one in an afternoon — no code.

THE SHIFT

You stop managing the AI. The AI starts managing the work — and surfaces only what needs your decision.

The 4 pillars

1. CONTEXT THAT FOLLOWS YOU

Create one living document your AI reads at the start of every session. It holds your North Star, active projects, decisions already made, and a running log of what just happened. This is the single source of truth, so you never re-explain yourself.

- ☐ Write your North Star (the one number or outcome that matters)
- ☐ List your active projects and their current goal
- ☐ Record decisions as you make them, so they're never re-litigated
- ☐ End each session by logging what changed

2. A ROLE CONTRACT

Tell your AI exactly who it is to you. Give it standing instructions: drive the plan, don't wait to be asked; protect commitments; reduce decisions, not effort; treat drafted-but-unshipped work as not done.

COPY-PASTE PROMPT

“You are my chief of staff. Each morning, set my top 1–3 tasks toward [GOAL]. When I bring new ideas, capture them and offer a trade against what's committed — never just say yes. Keep replies short and action-first.”

3. DELEGATION TO SUB-AGENTS

Treat each project like it has its own manager. Your chief of staff sets each manager's tasks; the managers do the work. Even solo, this keeps work organized by area instead of one giant to-do pile.

4. A DAILY CADENCE

A morning brief sets the plan. An evening close captures what shipped and what slipped. The rhythm is the system — it's what keeps momentum from leaking.

- ☐ Morning: review goals + carryover, set today's 1–3 moves

- ☐ Midday (optional): quick re-check
- ☐ Evening: what shipped, what slipped, what carries over

Your afternoon build checklist

- ☐ Create your context document (pillar 1)
- ☐ Paste the role-contract prompt (pillar 2)
- ☐ Name your projects + their managers (pillar 3)
- ☐ Run your first morning brief (pillar 4)
- ☐ Log one decision and one win before you close

REMEMBER

The goal isn't a smarter chatbot. It's never having to guess what to work on again.

What to do next

Run this for one week. Open every session by having your assistant read the context doc, and close every session by logging what changed. By day seven it will know your business well enough to brief you before you ask. That's a chief of staff.
